

Setup Process

Open the Box

Installer will examine the lawn and decide on the best wire layout.

Installer will point out any complications or areas unsuitable for the Robot.

Area

Setup with Robomow App

Customers will be lead step by step on how to use the application

N.B If the customer provides a compatible device at time of installation, the installer will carry out
The pairing of devices and show them how it works.

Types of Zone setups

A separated zone that **can be mowed** in a single operation

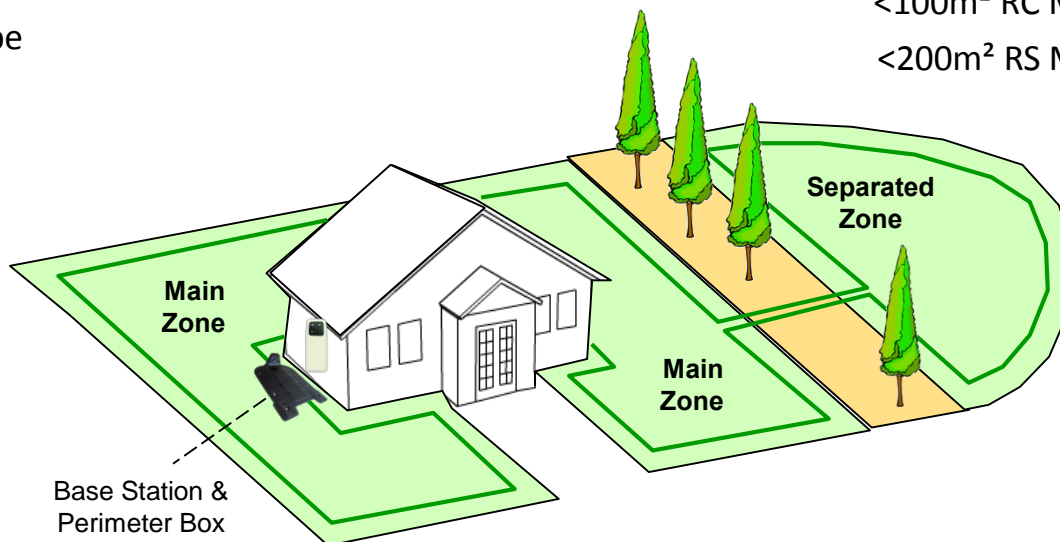

<100m² RC Models

<200m² RS Models

If possible, the separated area may be connected to the main area's Base station Perimeter Wire and no additional hardware is needed.

If a separated area is larger than 100m² For RC models or 200m² for RS models, then it requires more than a single operation to cover the area;

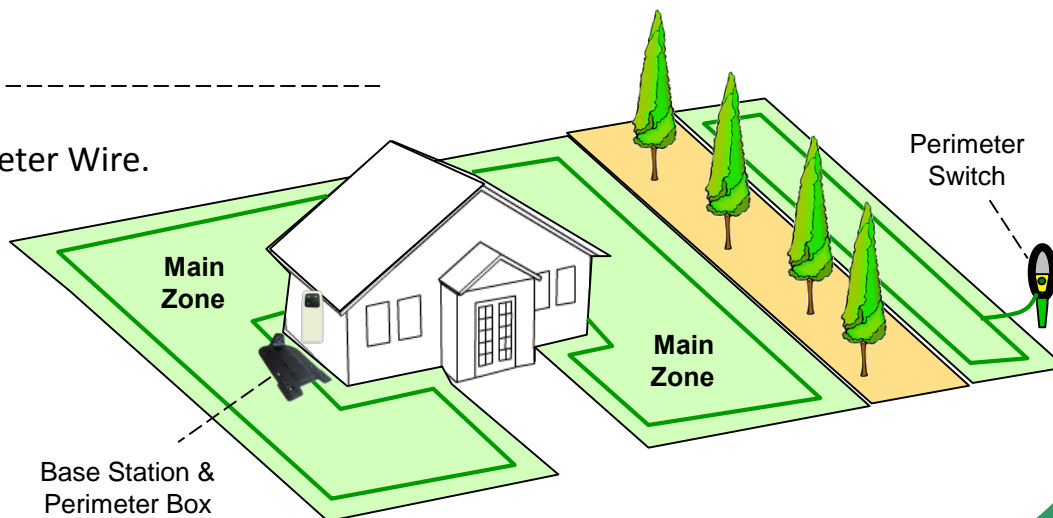

In such cases, an additional Base Station (optional accessory) should be installed in the Separated Zone

Or

It may have to have its own separate Perimeter Wire.

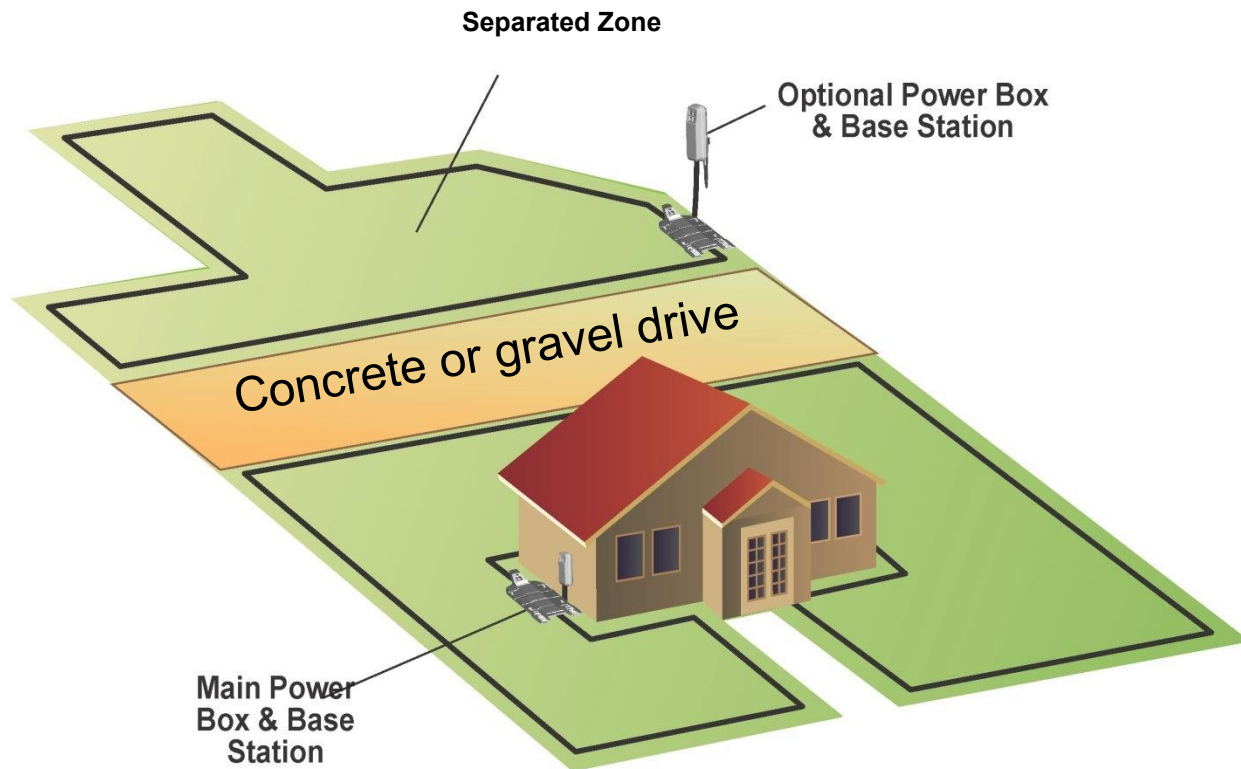

In that case, it will have to be connected to a Perimeter Switch (optional accessory).

Types of Separated Zone setups (cont.)

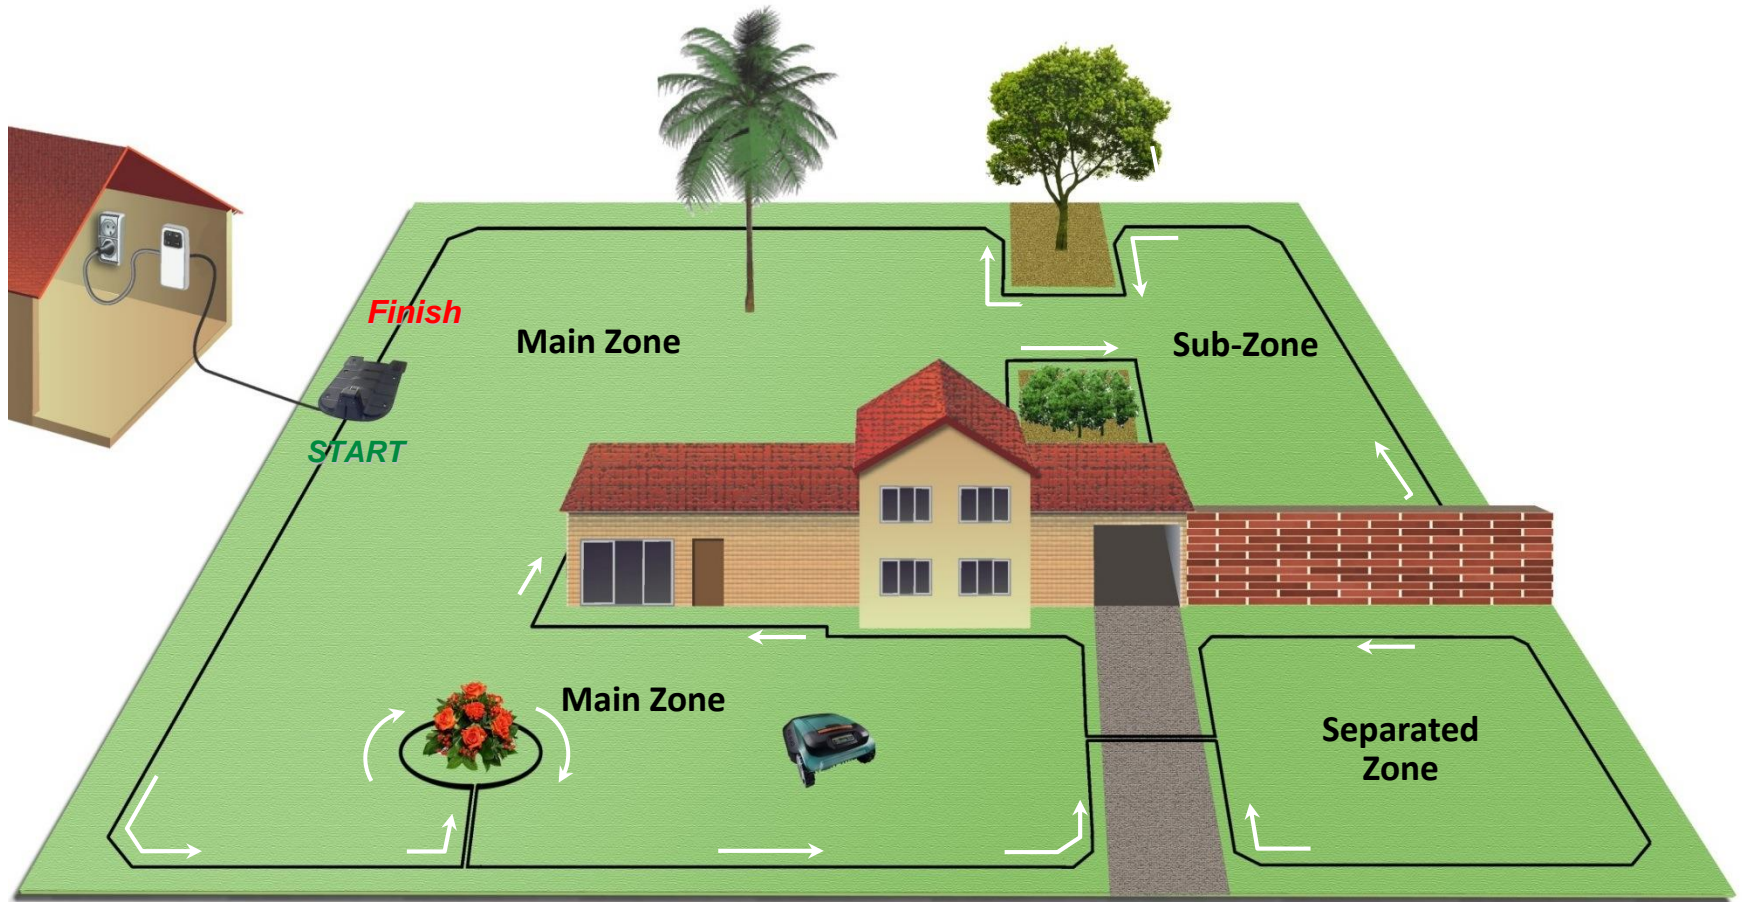

A separated zone that **cannot be mowed** in a single operation

An additional Base Station (optional accessory) should be installed in the additional area. Otherwise, the user will have to carry the mower several times to mow the Separated Zone.

An additional Base Station would be required (Sold separately)

Example of multi Zones connected to Base

No additional perimeter switch is required in this layout.
